Abstract: The present paper reports the microbiological examination and reporting of a clinical case of mastitis in female adult goat (doe) and its recommended therapeutic management with the selected broad spectrum antibiotics. The indiscriminate and injudicious administration of antibiotics and irrational treatment of mastitis with different antibiotics have invited serious complications like multiple drug resistance. Till date different types of antibiotics have been tried against the pathogens in mastitis with or without identification and drug sensitivity testing.

Keywords: Antibiotics, Antibiogram, Mastitis.

INTRODUCTION

Mastitis is usually caused by bacteria that invade the udder, multiply and produce toxins which are harmful to the mammary gland. It remains the most economically important disease of dairy industries around the world producing great economic loss to farmers. There are two forms of mastitis viz., clinical and sub clinical forms. Mastitis the chronic inflammation of the mammary gland of lactating dairy animals and can have infectious and non-infectious etiology. It is characterized by physical, chemical and usually bacteriological changes in the milk and pathological changes in the glandular tissue of the udder and affects quality and quantity of milk.¹⁻⁴

The present study was conducted to identify the etiology of clinical mastitis and the antibiotics/antibacterial drugs which show sensitivity against the various pathogenic agents.

MATERIALS AND METHODS

Two (2 No.) of blood stained milk samples were collected by hand stripping method in two separate sterile sample collection tubes from the clinically fibrosed affected quarters of the udder of a doe exhibiting clinical symptoms of mastitis which was produced at the Teaching Veterinary Clinical Complex (T.V.C.C.) of the college. The collected milk samples were then forwarded to the Department of Veterinary Microbiology during October, 2016 for bacteriological investigation and reporting.

The milk samples were examined bacteriologically⁵ for the colony characteristics by nutrient agar plate culturing. Bacterial staining was done by Gram’s Method⁶. The antibiotic sensitivity test was performed as per Kirby-Bauer antibiotic disc diffusion assay method on Mueller-Hinton agar plates with certain modifications¹ using antibiotic discs provided by the supplier (Titan Biotech Ltd., Bhiwadi, Rajasthan, India). The concentration of antibiotic in each filter paper disc was as per the specification of the manufacturer required for laboratory purpose. Incubation of the petridishes layered with the agar containing antibiotic discs was done at 37°C for 24 h in a B.O.D. incubator installed at the department.

RESULTS AND DISCUSSION

The milk samples were subjected to spread plate culture on two separate Mueller Hinton agar media plates⁶ from the two samples. After incubation at 37°C for 24 h it showed the presence of smooth,
raised, mucoid, circular colonies with regular edges in both the plates. Grams’ method of staining revealed Gram positive cocci arranged in the form of chains when examined under the high power magnification of the compound microscope. The bacteria was bacteriologically determined to be grouped under Streptococcus spp. [4, 6-9]

Antibiotic assay revealed the bacterial isolates to be highly sensitive to the antibiotics, Amikacin and Chloramphenicol with low degree of sensitivity to Streptomucin and Ceftriaxone respectively. The degree of sensitivity was determined on the basis of zone of inhibition formed by the isolated bacteria after exposure to the particular antibiotics by incubation.

The results obtained on cultural properties of the bacteria and its antibiotic disc diffusion assays revealed in the present study were in correlation with the findings of earlier investigators.[10-15]

CONCLUSION

The present study revealed the presence clinical of Streptococcus spp. of bacteria responsible for causing clinical mastitis in the fibroed quarters of the udder of the doe. The bacterial strain was found to be sensitive to broad spectrum antibiotics which was reported and recommended to the T.V.C.C. for their administration in divided doses on alternate daily intervals in mixed preparations.

ACKNOWLEDGEMENTS

The authors are thankful to Hon’ble Dean and Management (Hony. Chairman and Secretary, Aastha Society, Sikar) of Arawali Veterinary College, Sikar for providing the necessary facilities to conduct the research work.
