The Asymptotic Estimates of Discounted Penalty Functions in a Risk Model with Random Paying Dividends to Shareholders and Policyholders

Lei He∗, Lin Lin, Shuyi Zhou

Business School, Hunan Normal University, Changsha 410083, Hunan, P.R. China

Abstract: In this paper, we derive the asymptotic estimates for the Gerber-Shiu discounted penalty functions of the risk model with randomly paying dividends to shareholders and policyholders in [4] by constructing renewal equations. For the model, the asymptotic estimates for the ruin probability are obtained, which is a power function. Numerical examples show the effectiveness of the asymptotic estimates.

Keywords: Discounted penalty function, Renewal equation, Ruin probability

1. INTRODUCTION

We consider the surplus process

\[ U(t) = u + t - \sum_{k=1}^{t} \xi_{k}X_{k} - \sum_{k=1}^{t} \left[ \eta^{(1)}_{k}I(U(k-1) \geq a_{1}) + \eta^{(2)}_{k}I(U(k-1) \geq a_{2}) \right], \quad (1.1) \]

where \( u \geq 0, a_{1} \geq 0, a_{2} > a_{1}, t \in \mathbb{N}^{*}, \xi = \{\xi_{t}, t = 1, 2, \cdots\}, X = \{X_{t}, t = 1, 2, \cdots\} \) and \( \eta^{(i)} = \{\eta^{(i)}_{k}, t = 1, 2, \cdots\}(i = 1, 2) \) are stochastic processes in some probability space \((\Omega, \mathcal{F}, P)\), \( I(B) \) is the indicator function of a set \( B \). \( \xi = \{\xi_{t}, t = 1, 2, \cdots\} \) is a series with the common distribution which is the binomial distribution \( B(p)(0 < p < 1) \). \( X = \{X_{t}, t = 1, 2, \cdots\} \) is assumed to be independent and identically distributed as \( F = \{f(k) = Pr(X = k); k = 1, 2, \cdots\} \). \( \eta^{(i)} = \{\eta^{(i)}_{k}, t = 1, 2, \cdots\} \) is independent and identically distributed; the common distribution is binomial distribution \( B(q_{i}), q_{i} \in (0, 1)(i = 1, 2) \), and the random series \( \xi, X, \eta^{(1)}, \eta^{(2)} \) are mutually independent (see [4] for the study of related model). The model had been built to describe the fact that the joint-stock company may pay the dividends to the policyholders and shareholders by [4]. The model can be interpreted as follows: \( u \) is the initial capital; \( a_{1}, a_{2} \) are the thresholds of paying dividends for shareholders and policyholders respectively. The premium in unit time is one and the number of claim is \( \xi_{t} \) in the time period \((t-1,t] \). If a claim occurs in \((t-1,t] \), the amount of claim is \( X_{t} \). When the surplus \( U(t-1) \) is not less than \( a_{1} \), the dividends \( \eta^{(1)}_{t} \) will be given to the policyholders. The dividends \( \eta^{(2)}_{t} \) will be paid to shareholders when the \( U(t-1) \) is no less than \( a_{2} \). More detail can be seen in [4].

It’s known that the discounted penalty function can be used to obtain quantity related with ruin, such as ruin probability. For discrete time risk model, recursive formulas of the discounted penalty function about initial surplus are usually calculate the quantity related with ruin. However, recursive formulas of the discounted penalty function is not effectively comparing to the asymptotic results about it. The asymptotic results about quantity related with ruin in other risk model have been studied extensively, such as [1, 2, 3], and so on. The estimation for the ruin probability of a discrete time model under nonnegative random interest rate has been obtained in [1]. And [3] establishes some asymptotic results for both finite and infinite ruin probability in a...
discrete time risk model with constant interest rate and upper-tail independent for the risks which belong to regularly varying tail class. What’s more, the asymptotic estimate for the discounted penalty function has been obtained in the compound binomial model with randomized decisions on paying dividends, and used to derive the asymptotic estimates for ruin probability and other quantity related with ruin in [2]. For the model (1.1), the recursive formulas of discounted penalty function has been derived (see [4]), but the asymptotic estimate for penalty function have not been obtained. Therefore, the aim of this paper is to obtain the asymptotic estimate for the discounted penalty function in [4], and use it to derive the asymptotic estimates for ruin probability and other quantities related with ruin. The results improve the study about the ruin problem under the compound binomial risk model with randomly paying dividends to shareholders and policyholders. So it is meaningful for analyzing how quantities related with ruin of joint insurance company are affected by the dividends paid to shareholders and policyholders.

This paper is organized as follows: In Section 2, the preliminaries will be shown. In Section 3, we will derive the asymptotic estimate for the discounted penalty function. In Section 4, the asymptotic estimates of the ruin probability and the distribution function of deficit at ruin will be obtained by the discounted penalty function. The conclusions will be shown in the section 5.

2. PRELIMINARIES

Define ruin time with. $T = \inf \{ t \geq 0 | U(t) < 0 \}$ The Gerber-Shiu discounted penalty function is represented as

$$
\phi_r(u) = E[\omega(U_{T-1}, U_T) I(T < +\infty) r^T | U(0) = u],
$$

(2.1)

where $\omega(x, y)$ is the non negative bounded function for $x \geq 0$, $y \geq 0$, $0 < r \leq 1$. In this paper, we only obtain the asymptotic estimate for $\phi_1(u)$. Let $\phi(u) = \phi_1(u)$, i.e., the discount factor $r = 1$. And the fact $\sum_{k=1}^{n-1} m_k = 0$ is adopted. For the convenient of calculation, let $P(n) = \sum_{k=1}^{n-1} f(k), \bar{P}(n) = 1 - P(n)$, we always assume $\mu = \sum_{k=0}^{+\infty} kf(k) = \sum_{k=0}^{+\infty} \bar{P}(n) < \infty$, and $E(\zeta_1 X_1 + \eta_1^{(1)} + \eta_1^{(2)}) = \mu p + q_1 + q_2 < 1$, which leads to a positive security loading $\theta = \frac{1 - \mu p - q_1 - q_2}{p}.

Lemma 1. For the model (1.1), let

$$H(x) = p_1 p_2 f(x) + (q_1 p_2 + p_1 q_2) f(x - 1) + q_1 q_2 f(x - 2)
$$

$$C(x) = p_1 p_2 \bar{P}(x) + (q_1 p_2 + p_1 q_2) \bar{P}(x - 1) + q_1 q_2 \bar{P}(x - 2),
$$

$$T(x) = p_1 f(x) + q_1 f(x - 1), \quad L(x) = p_1 \bar{P}(x) + q_1 \bar{P}(x - 1),
$$

then, (A) (i) if $a_1 > 0$, for all $u \leq a_2$, $\phi(0), \phi(1), \cdots, \phi(a_2)$ satisfy the following linear equations:

$$q_1 \phi(0) - q_2 \phi(a_2 - 1) - q_1 \phi(a_1 - 1) = \delta',
$$

(2.2)

for $u = 0, 1, \cdots, a_1 - 1$,

$$q_1 \phi(u + 1) + (pf(1) - 1) \phi(u) + \sum_{k=0}^{u-1} \phi(k) f(u + 1 - k) = \Delta_1(u = 1),
$$

(2.3)

for $u = a_1, a_1 + 1, \cdots, a_2 - 1$,

$$qp_1 \phi(u + 1) + (q_1 p + pp_1 f(1) - 1) \phi(u) + \sum_{k=0}^{u-1} \phi(k) T(u + 1 - k) = \Delta_2(u + 1),
$$

(2.4)

where

$$\Delta_1(u + 1) = -p \sum_{k=u+2}^{+\infty} \omega(u, k - u - 1) f(k)$$

International Journal of Scientific and Innovative Mathematical Research (IJSIMR)
\[
\Delta_2(u + 1) = -p \sum_{k=-u}^{+\infty} \omega(u, k - u) T(k + 1)
\]
\[
\delta' = p \sum_{k=1}^{+\infty} \sum_{i=k}^{\infty} \omega(k, i - k) H(i + 2) + p \sum_{k=1}^{a_2 - 2} \sum_{i=k}^{+\infty} \omega(k, i - k) f(i + 1)
\]
\[
+ pp_2 \sum_{i=a_2}^{+\infty} \omega(a_2 - 1, i - a_2 + 1) T(i + 1)
\]
\[
+ pp_1 \sum_{i=a_1}^{+\infty} \omega(a_1 - 1, i - a_1 + 1) f(i + 1).
\]

(ii) if \( a_1 = 0 \), for \( u \leq a_2 \), \( \phi(0), \phi(1), \ldots, \phi(a_2) \) satisfy the following linear equations

\[
qq_1 \phi(0) - q_2 \phi(a_2 - 1) = \delta'',
\]  
(2.5)

for \( u = 0, 1, \ldots, a_2 - 1 \),

\[
ap_1 \phi(u + 1) + (qq_1 + pp_1 f(1) - 1) \phi(u) + pp_2 \phi(k) T(u + 1 - k) = \Delta_2(u + 1),
\]  
(2.6)

Where

\[
\delta'' = pp_2 \sum_{u=0}^{a_2 - 1} \sum_{k=-u}^{+\infty} \omega(u, k - u) T(k + 1) + ppp_2 \sum_{u=0}^{a_2 - 2} \sum_{k=-u}^{+\infty} \omega(u, k - u) T(k + 1)
\]
\[
+ p \sum_{u=a_2}^{+\infty} \sum_{k=-u}^{+\infty} \omega(u, k - u + 1) H(k + 2).
\]

(B) for \( u \geq a_2 \),

\[
\phi(u + 1) = \frac{1 - q(q_1 p_2 + p_1 q_2)}{qq_2 p_1} \phi(u) - \frac{qq_2}{pp_2} \phi(u - 1) - \frac{p}{qq_1 p_2} \sum_{k=0}^{u} \phi(k) H(u + 1 - k)
\]
\[
- \frac{p}{pp_1 p_2} \sum_{k=-u}^{+\infty} \omega(u, k - u + 1) H(k + 2).
\]  
(2.7)

Proof. See [4].

Let \( D = \xi_1 X + \eta_1^{(1)} + \eta_1^{(2)} \). Denote the generating function of \( D \) by \( G_D(r) \), then

\[
G_D(r) = (pG_X + q)(p_1 + q_1 r)(p_2 + q_2 r),
\]  
(2.8)

where \( G_X \) is the generating function of \( X \).

Similar to the one in [2], assuming exists a \( r_\infty \) such that \( G_X(r) \rightarrow +\infty (r \rightarrow r_\infty) (r_\infty \) is possibly \( +\infty \).

Consider equation

\[
(pG_X(r) + q)(p_1 r + q_1)(p_2 + q_2 r) = r.
\]  
(2.9)
Let \( H(r) = (pG_X(r) + q)(p_1 + q_1 r)(p_2 + q_2 r) \). \( H(0) = q q_1 q_1, H(1) = 1, \) \( H(r) \) is a convex and increasing function in \( [0, r_\infty) \), thus equation (2.9) has two real non-negative roots at most, and one of them is 1. Because \( \theta > 0, H'(1) = p \mu + q_1 + q_2 < 1. \) Owing to \( H''(r) > 0 \) in \( [0, r_\infty) \), \( H(r) \) is strictly convex in \( [0, r_\infty) \). Therefore, there exist two real roots in (2.9). Denote the other root by \( R \), then \( R > 1. \)

**Lemma 2.** \( Z \) is a set of integers, \( \{a_k, k \in Z\}, \{b_k, k \in Z\}, \{u_k, k \in Z\} \) are sequences that satisfy \( a_k \geq 0, \sum_{k=-\infty}^{+\infty} a_k = 1, \sum_{k=-\infty}^{+\infty} |k|a_k < +\infty, \sum_{k=-\infty}^{+\infty} ka_k > 0, \sum_{k=-\infty}^{+\infty} |b_k| < +\infty, \) the greatest common divisor of the integers \( k \) for which \( a_k > 0 \) is 1, the bounded series \( u_k \) satisfies the following renewal equation

\[
 u_n = \sum_{k=-\infty}^{+\infty} a_{n-k}u_k + b_n, \quad n = 0, \pm 1, \pm 2, \ldots. \tag{2.10}
\]

then \( \lim_{n \to \infty} u_n \) and \( \lim_{n \to -\infty} u_n \) exist. Furthermore, if \( \lim_{n \to -\infty} u_n = 0 \), then

\[
 \lim_{n \to -\infty} u_n = \frac{\sum_{k=-\infty}^{+\infty} b_k}{\sum_{k=-\infty}^{+\infty} ka_k}. \tag{2.11}
\]

**Proof.** See [5](Chapter 3).

**3. ASYMPTOTIC ESTIMATES**

Let

\[
 \Xi_1(u, \omega) = p q_2 \sum_{k=0}^{u-2} \sum_{i=k+2}^{+\infty} \omega(k, i - k - 1)f(i) + p p_2 \sum_{k=0}^{u-1} \sum_{i=k+2}^{+\infty} \omega(k, i - k - 1)f(i),
\]

\[
 \Xi_2(u, \omega) = p p_2 \sum_{k=0}^{u-1} \sum_{i=k+1}^{+\infty} \omega(k, i - k)T(i + 1) + p q_2 \sum_{k=0}^{u-2} \sum_{i=k+1}^{+\infty} \omega(k, i - k)T(i + 1)
\]

\[
 + p q_1 \sum_{k=0}^{u-1} \sum_{i=k+2}^{+\infty} \omega(k, i - k - 1)f(i) + p p_1 \sum_{k=0}^{u-1} \sum_{i=k+2}^{+\infty} \omega(k, i - k - 1)f(i).
\]

\[
 \Xi_3(u, \omega) = p p_2 \sum_{k=0}^{u-1} \sum_{i=k+1}^{+\infty} \omega(k, i - k)T(i + 1) + p q_2 \sum_{k=0}^{u-2} \sum_{i=k+1}^{+\infty} \omega(k, i - k)T(i + 1),
\]

\[
 \Xi_4(u, \omega) = (R - 1)R^u \sum_{k=0}^{+\infty} \sum_{i=k}^{+\infty} \omega(k, i - k + 1)H(i + 2),
\]

**Theorem 1.** For the model (1.1), when \( a_1 > 0 \), the asymptotic estimate for the discounted penalty function \( \phi(u) \) is
The Asymptotic Estimates of Discounted Penalty Functions in a Risk Model with Random Paying Dividends to Shareholders and Policyholders

\[ \phi(u) \sim \frac{K_{\alpha_1, \alpha_2}}{K_0} R^{-u}, \quad (3.1) \]

Where

\[
K_{\alpha_1, \alpha_2} = K_1 - (R - 1)K_2 - (R - 1) \sum_{u=\alpha_1+1}^{\alpha_2} R^u \Xi_2(u, \omega) + p \sum_{u=\alpha_2+1}^{+\infty} \Xi_1(u, \omega),
\]

\[
K_0 = [qq_1 q_2 + pp_1 p_2 P(1) + p(q_1 p_2 + p_1 q_2) + pq_1 q_2] R(R - 1)
+ p(R - 1) \sum_{k=2}^{+\infty} k R^k G(k),
\]

\[
K_1 = (R - 1) (qq_1 p_2 \phi(0) + (qq_1 p_1 \phi(0) - (qq_1 q_2 + pp_1 p_2 P(1)) \phi(0)) R
-(p(q_1 p_2 + p_1 q_2) + pq_1 q_2) \phi(0) R(R - 1) + (R - 1) q q_1 p_2 \phi(2) R^2
- ((qq_1 q_2 + pp_1 p_2 P(1) + p(q_1 p_2 + p_1 q_2) + pq_1 q_2) \phi(1) - p \phi(0)) R^2
- q \phi(0)(R^{\alpha_2+1} - R^2) - q \phi(\alpha_1 - 1)(R^{\alpha_2+1} - R^{\alpha_1+1}),
\]

\[
K_2 = q_1 p_2 \sum_{u=2}^{\alpha_1} R^u \phi(u - 1) + q_2 \sum_{u=2}^{\alpha_2} R^u \phi(u - 1) + q_1 q_2 \sum_{u=2}^{\alpha_1} R^u \phi(u - 2)
+ p_2 \sum_{u=2}^{\alpha_1} \Xi_1(u, \omega) R^u + p_2 \sum_{u=2}^{\alpha_2} \Xi_1(u, \omega) R^u.
\]

Proof: When \( u \geq \alpha_2 \), we can find

\[
\phi(u) = q p_1 p_2 \phi(u + 1) + q(q_1 p_2 + p_1 q_2) \phi(u) + q q_1 q_2 \phi(u - 1)
+ p \sum_{k=0}^{u} \phi(u) H(u + 1 - k) + p \sum_{k=0}^{+\infty} \omega(u, k - u + 1) H(k + 2).
\quad (3.2)
\]

For \( t \geq \alpha_2 \), subtracting \( q \phi(u) \) from both sides of (3.2), using the \( p_1 p_2 + q_1 p_2 + p_1 q_2 + q_1 q_2 = 1 \), summing it over \( u \) from \( \alpha_2 \) to \( t \) and interchanging the order of summation, we can obtain

\[
q p_1 p_2 (\phi(t + 1) - \phi(\alpha_2)) = q q_1 q_2 (\phi(t) - \phi(\alpha_2 - 1)) + p \sum_{k=0}^{t} \phi(u) G(t + 1 - k)
- p \sum_{k=0}^{\alpha_2-1} \phi(k) G(\alpha_2 - k)
- p \sum_{k=\alpha_2}^{t} \sum_{i=0}^{+\infty} \omega(k, i - k + 1) H(i + 2).
\quad (3.3)
\]

Owing to the relative security loading \( \theta > 0 \), \( \lim_{u \to 0} \psi = 0 \), \( |\phi(u)| \leq ||\omega|| \psi(u) \), where \( ||\omega|| = \sup \{|\omega(x, y)| | x, y \geq 0 \} \), then \( \lim_{u \to 0} \phi(u) = 0 \). By the dominated convergence theorem, the following inequality can be obtained:

\[
0 \leq p \sum_{k=0}^{+\infty} \phi(k) G(t + 1 - k) = p \sum_{k=0}^{t} \phi(t - k) G(k + 1)
\leq p \sum_{k=0}^{+\infty} \phi(t - k) G(k + 1) \to 0.
\]

Then, \( p \sum_{k=0}^{t} \phi(k) G(t + 1 - k) \to 0 \). Let \( t \to 0 \) in (3.3), it can be found that

\[
q p_1 p_2 \phi(\alpha_2) = q q_1 q_2 (\phi(0) - \phi(\alpha_2 - 1)) + p \sum_{k=0}^{\alpha_2-1} \phi(k) G(\alpha_2 - k)
+ p \sum_{k=\alpha_2}^{+\infty} \sum_{i=0}^{+\infty} \omega(k, i - k + 1) H(i + 2).
\quad (3.4)
\]

(3.3) plus (3.4), we can obtain

\[
q p_1 p_2 \phi(t + 1) - q q_1 q_2 \phi(t) = p \sum_{k=0}^{t} \phi(k) G(t + 1 - k)
+ p \sum_{k=t+1}^{+\infty} \sum_{i=0}^{+\infty} \omega(k, i - k + 1) H(i + 2).
\quad (3.5)
\]
Replacing $t + 1$ by $t$ and plus the $(q_1 + p_1 q_2 + p p_1 p_2) \phi(t)$ in both sides of (3.5), we get
\[
\phi(t) = (q_1 + p_1 q_2 + p p_1 p_2) \phi(t) + p \sum_{k=t}^{+\infty} \sum_{i=k}^{+\infty} \omega(k, i - k + 1) H(i + 2)
\]
\[
+ \left( q_1 q_2 + p p_1 p_2 \bar{P}(1) + p(q_1 p_2 + p_1 q_2) + p q_1 q_2 \right) \phi(t - 1)
\]
\[
+p \sum_{k=0}^{t-2} \phi(k) G(t - k), t > a_2. \tag{3.6}
\]

Rewriting the (3.4), for $0 \leq u < a_1$, $a_1 > 0$, we can obtain
\[
\phi(u) = q \phi(u + 1) + p \sum_{k=1}^{u+1} \phi(u + 1 - k) f(k) + p \sum_{k=u+2}^{+\infty} \omega(u, k - u - 1) f(k). \tag{3.7}
\]

Subtracting $q \phi(u)$ from both sides (3.7), summing it over $u$ from 0 to $t - 1 (0 < t \leq a_1)$, and interchanging the order of summation, for $0 < t \leq a_1$, we obtain
\[
q (\phi(t) - \phi(0)) = p \sum_{k=0}^{t} \phi(k) \bar{P}(t - k) - p \sum_{u=0}^{t-1} \sum_{k=u+2}^{+\infty} \omega(u, k - u - 1) f(k). \tag{3.8}
\]

Replacing $t$ by $t - 1$ in (3.8), and adding $p \phi(t - 1)$ to both sides of it, for $1 < t \leq a_1$, we get
\[
\phi(t - 1) - q \phi(0) = p \sum_{k=0}^{t} \phi(k) \bar{P}(t - k) - p \sum_{u=0}^{t-2} \sum_{k=u+2}^{+\infty} \omega(u, k - u - 1) f(k). \tag{3.9}
\]

From (3.8) $\times p_1 + (3.9) \times q_1$, for $1 < t \leq a_1$ we obtain
\[
q p_1 \phi(t) + q_1 \phi(t - 1) - q \phi(0) = p \sum_{k=0}^{t-1} \phi(k) L(t - k) - \Xi_1(t, \omega). \tag{3.10}
\]

Replacing $t$ by $t - 1$ in (3.10) and plus $p \phi(t - 1)$, for $2 < t \leq a_1$, we obtain
\[
(q p_1 + p) \phi(t - 1) + q_1 \phi(t - 2) - q \phi(0) = p \sum_{k=0}^{t-1} \phi(k) L(t - k - 1)
\]
\[- \Xi_1(t - 1, \omega). \tag{3.11}
\]

From $p_2 \times (3.10) + q_2 \times (3.11)$, for $2 < t \leq a_1$, we can obtain
\[
q p_1 p_2 \phi(t) = q \phi(0) - (q_1 p_2 + q p_1 q_2 + p q_2) \phi(t - 1) - q_1 q_2 \phi(t - 2)
\]
\[
+p \sum_{k=0}^{t-1} \phi(k) G(t - k) - p_2 \Xi_1(t, \omega) - q_2 \Xi_1(t - 1, \omega). \tag{3.12}
\]

Rewriting (2.4), for $a_1 \leq u < a_2$, we obtain
\[
\phi(u) = q p_1 \phi(u) + p \sum_{k=1}^{u} \phi(k) T(u + 1 - k) + p \sum_{u+1}^{+\infty} \omega(u, k - u) T(k + 1). \tag{3.13}
\]

Subtracting $q \phi(u)$ from both sides of (3.13), summing it over $u$ from $a_1$ to $t - 1 (a_1 \leq t < a_2)$ and interchanging the order of summation, we obtain
\[
q p_1 (\phi(t) - \phi(a_1)) = p \sum_{k=0}^{t-1} \phi(k) L(t - k) - p \sum_{k=0}^{t-1} \phi(k) L(a_1 - k)
\]
\[-p \sum_{u-a_1}^{a_1-1} \sum_{k-u+1}^{+\infty} \omega(u, k-u)T'(k+1). \quad (3.14)\]

Let \( t = a_1 \) in (3.10), we can obtain

\[ q_1\phi(a_1) + q_1\phi(a_1-1) - q_1\phi(0) = p \sum_{k=0}^{a_1-1} \phi(k)L(t-k) - \Xi_1(t, \omega). \quad (3.15) \]

Adding (3.14) to (3.15), for \( a_1 \leq t < a_2 \), we obtain

\[ q_1\phi(t) + q_1\phi(a_1-1) - q_1\phi(0) = p \sum_{k=0}^{t-1} \phi(k)L(t-k) \]
\[ -p \sum_{u-a_1}^{a_1-1} \sum_{k-u+1}^{+\infty} \omega(u, k-u)T'(k+1). \quad (3.16) \]

Replacing \( t \) by \( t-1 \) in the (3.16), and adding \( p\phi(t-1) \) to both sides of it, for \( a_1 < t \leq a_2 \), we can obtain

\[ (p + q_1)\phi(t-1) + q_1\phi(a_1-1) = q_1\phi(0) + p \sum_{k=0}^{t-1} \phi(k)L(t-k-1) \]
\[ -p \sum_{u=a_1}^{t-2} \sum_{k-u+1}^{+\infty} \omega(u, k-u)T'(k+1). \quad (3.17) \]

From \( \phi(t) \) in (3.17), and adding \((q_1 + p_1q_2 + pp_1p_2)\phi(t)\) in both sides of it, for \( a_1 < t \leq a_2 \), we obtain

\[ \phi(t) = (q_1 + p_1q_2 + pp_1p_2)\phi(t) - \Xi_2(t, \omega) - q_2\phi(t-1) - q_1\phi(a_1-1) + q_1\phi(0) \]
\[ + (q_1q_2 + pp_1p_2\bar{P}(1) + p(q_1p_2 + p_1q_2) + pp_1q_2)\phi(t-1) \]
\[ + p \sum_{k=0}^{t-2} \phi(k)G(t-k). \quad (3.18) \]

Combining (3.12), (3.18) and (3.6), we get

\[ \phi(u) = (q_1 + p_1q_2 + pp_1p_2)\phi(u) \]
\[ + (q_1q_2 + pp_1p_2\bar{P}(1) + p(q_1p_2 + p_1q_2) + pp_1q_2)\phi(u-1) \]
\[ + p \sum_{k=0}^{u-2} \phi(k)G(u-k) \]
\[ + \begin{cases} 
q_1p_2\phi(1) - (q_1q_2 + pp_1p_2\bar{P}(1) \\
+ p(q_1p_2 + p_1q_2) + pp_1q_2)\phi(0), \quad u = 1, \\
q_1p_2\phi(2) - (q_1q_2 + pp_1p_2\bar{P}(1))\phi(1) \\
- (p(q_1p_2 + p_1q_2) + pp_1q_2)\phi(1) - p\phi(0), \quad u = 2, \\
q_1\phi(0) - (q_1p_2 + q_2)\phi(u-1) - q_1q_2\phi(u-2) \]
\[-p_2\Xi_1(u, \omega) - q_2\Xi_1(u-1, \omega), \quad 2 < u \leq a_1, \]
\[q_1\phi(0) - q_2\phi(u-1) - q_1\phi(a_1-1) - \Xi_2(u, \omega), \quad a_1 < u \leq a_2, \]
\[p \sum_{k=u}^{+\infty} \sum_{i=k}^{+\infty} f(k, i-k)H(i+2), \quad a_2 < u. \quad (3.19) \]
We denote \( \overline{\phi}(u) = \phi(u)R^u \),

\[
a_u = \begin{cases} 
q_1 + p_1 q_2 + pp_1 p_2, & u = 0, \\
R(qq_1 q_2 + pp_1 p_2 P(1) + p(q_1 p_2 + p_1 q_2) + pp_1 q_2), & u = 1, \\
pR^n G(u), & u \geq 2.
\end{cases}
\]

\[
b_u = \begin{cases} 
q_1 p_1 p_2, & u = 0, \\
R(qp_1 p_2 \phi(1) - (qq_1 q_2 + pp_1 p_2 \bar{P}(1)) + p(q_1 p_2 + p_1 q_2) \phi(0)), & u = 1, \\
R^2 (qp_1 p_2 \phi(2) - (qq_1 q_2 + pp_1 p_2 \bar{P}(1))), & u = 2, \\
-R^2 ((p(q_1 p_2 + p_1 q_2) + pp_1 q_2) \phi(1) - p \phi(0)), & 2 < u \leq a_1, \\
R^u (q \phi(0) - (q_1 p_2 + q_2) \phi(u - 1) - q_1 q_2 \phi(u - 2)), & a_1 < u \leq a_2, \\
R^u p \sum_{k=0}^{+\infty} \sum_{i=0}^{a_1} f(k, i - k) H(i + 2), & a_2 < u.
\end{cases}
\]

Multiplying (3.19) by \( R^u \), we can obtain

\[
\overline{\phi}(u) = \sum_{k=0}^{+\infty} a_{u-k} \overline{\phi}(k) + b_u, \quad u = 0, 1, 2, \ldots \tag{3.20}
\]

We will prove that the (3.20) satisfies the conditions of Lemma 2.

\[
\sum_{k=0}^{+\infty} a_k = q_1 + p_1 q_2 + pp_1 p_2 + R(qq_1 q_2 + pp_1 p_2 P(1) + p(q_1 p_2 + p_1 q_2) + pp_1 q_2) \\
+ \sum_{k=2}^{+\infty} pG(k) R^k + pp_1 q_2 R^2 \sum_{k=0}^{+\infty} P(k) R^k \\
= q_1 + p_1 q_2 + q_1 q_2 R + (pp_1 p_2 + p(q_1 p_2 + p_1 q_2) + pp_1 q_2 R^2) \frac{G_X(R) - 1}{R - 1} \\
= 1.
\]

where the last equation is valid because \( R \) is the root of the (2.9). The following step is to prove \( \sum_{k=0}^{+\infty} |b_k| < \infty \). For \( u > x \)

\[
0 \leq b_u \leq p||\omega||R^u \sum_{k=x}^{+\infty} J(k - 1) G(k + 1),
\]

then,

\[
\sum_{u=q_2+1}^{+\infty} b_u \leq p||\omega|| \sum_{u=1}^{+\infty} R^u \sum_{k=u}^{+\infty} G(k + 1). \tag{3.21}
\]

Considering the right part of the above inequality

\[
\sum_{u=1}^{+\infty} R^u \sum_{k=u}^{+\infty} G(k + 1) = \sum_{k=1}^{+\infty} \sum_{u=1}^{k} R^u G(k + 1)
\]
The Asymptotic Estimates of Discounted Penalty Functions in a Risk Model with Random Paying Dividends to Shareholders and Policyholders

\[
\begin{align*}
&= p \sum_{k=1}^{+\infty} \frac{G(k + 1) R^k - R}{R - 1} \\
&\leq \frac{1}{R(R - 1)} \sum_{k=1}^{+\infty} pG(k + 1) R^{k+1} \\
&\leq \frac{1}{R(R - 1)} \sum_{k=0}^{+\infty} a_k \\
&= \frac{1}{R(R - 1)}.
\end{align*}
\] (3.22)

From (3.21) and (3.22), we can obtain \( \sum_{u=a_2+1}^{+\infty} b_u < +\infty \). And Because \(|b_k| < +\infty (0 \leq u \leq a_2)\), \( \sum_{u=0}^{+\infty} b_u < +\infty \).

\[
\sum_{u=0}^{+\infty} b_u = \frac{K_1}{R - 1} - K_2 - \sum_{u=a_1+1}^{a_2} R^u \Xi_2(u, \omega) + p \sum_{u=a_2+1}^{+\infty} \Xi_4(u, \omega).
\] (3.23)

According to Lemma 2.2, we can get

\[
\lim_{u \to +\infty} \tilde{\phi}(u) = \frac{K_{a_1,a_2}}{K_0}.
\] (3.24)

(3.24) is equivalent to (3.1). The proof is completed.

**Theorem 2.** For the model (1.1), when \( a_1 = 0 \), the asymptotic estimate for the discounted penalty function \( \phi(u) \) is

\[
\phi(u) \sim \frac{K(0, a_2)}{K_0} R^{-u},
\] (3.25)

where

\[
K(0, a_2) = K_3 - q_2(R - 1) \sum_{u=0}^{a_2} R^u \phi(u - 1) - (R - 1) \sum_{u=1}^{a_2} R^u \Xi_3(u, \omega)
\]

\[
+ p(R - 1) \sum_{u=a_2}^{+\infty} \Xi_4(u, \omega)
\]

\[
K_0' = [qq_1q_2 + pp_1p_2 \overline{P}(1) + p(q_1p_2 + p_1q_2) + pq_1q_2]R(R - 1) + p(R - 1) \sum_{k=2}^{+\infty} kR^k G(k),
\]

\[
K_3 = qp_1p_2 \phi(0)(R - 1) + qp_1\phi(0)(R^u - R)
\]

\[
+ (q_1p_2\phi(1) - (qq_1q_2 + pp_1p_2 \overline{P}(1) + p(q_1p_2 + p_1q_2) + pq_1q_2) \phi(0)) R(R - 1).
\]
The Asymptotic Estimates of Discounted Penalty Functions in a Risk Model with Random Paying Dividends to Shareholders and Policyholders

Proof. Subtracting $q\phi(u)$ from both sides of (2.6), summing it over $u$ from 0 to $t - 1 (0 < t \leq a_2)$ and interchanging the order of summation, we obtain

$$q_p(t - \phi(0)) = p \sum_{k=0}^{t-1} \phi(k)L(t - k) - p \sum_{u=0}^{t-1} \sum_{k=u+1}^{+\infty} \omega(u, k - u)T(k + 1). \tag{3.26}$$

Replacing $t$ by $t - 1$ in (3.26) and adding $p\phi(t - 1)$ to both sides of it, for $1 < t \leq a_2$, we get

$$(q_p + p)\phi(t - 1) - q_p\phi(0) = p \sum_{k=0}^{t-1} \phi(k)L(t - k - 1) - p \sum_{u=0}^{t-2} \sum_{k=u+1}^{+\infty} \omega(u, k - u)T(k + 1). \tag{3.27}$$

From (3.26) \times p_2 + (3.27) \times q_2, for $1 < t \leq a_2$, and plus $(q_1 + p_1q_2 + pp_1p_2)\phi(u)$ in both sides of it, we obtain

$$\phi(u) = (q_1 + p_1q_2 + pp_1p_2)\phi(u) + p \sum_{k=0}^{u-2} \phi(k)G(u - k) + (qq_1q_2 + pp_1p_2\bar{P}(1) + p(q_1p_2 + p_1q_2) + pq_1q_2)\phi(u - 1) + q_p\phi(0) - q_2\phi(u - 1) - \Xi(u, u, \omega), 1 < t \leq a_2. \tag{3.28}$$

Combining the (3.28) and (3.6), we can obtain

$$\phi(u) = (q_1 + p_1q_2 + pp_1p_2)\phi(u) + (qq_1q_2 + pp_1p_2\bar{P}(1) + p(q_1p_2 + p_1q_2) + pq_1q_2)\phi(u - 1) + p \sum_{k=0}^{u-2} \phi(k)G(u - k) + \left\{ \begin{array}{cl}
q_p^2\phi(1) - (qq_1q_2 + pp_1p_2\bar{P}(1))\phi(0), & u = 1 \\
-p(q_1p_2 + p_1q_2) + pq_1q_2\phi(0), & 0 < u \leq a_2, \\
p \sum_{k=u}^{+\infty} \sum_{i=k}^{+\infty} f(k, i - k)H(i + 2), & a_2 < u. \end{array} \right. \tag{3.29}$$

We denote $\tilde{\phi}(u) = \phi(u)R^u$,

$$a_u = \left\{ \begin{array}{cl}
q_1 + p_1q_2 + pp_1p_2, & u = 0, \\
R(q_1q_2 + pp_1p_2\bar{P}(1) + p(q_1p_2 + p_1q_2) + pq_1q_2), & u = 1, \\
pR^uG(u), & u \geq 2. \end{array} \right. \tag{3.30}$$

$$b_u = \left\{ \begin{array}{cl}
q_p, & u = 0, \\
(q_p^2\tilde{\phi}(1) - (qq_1q_2 + pp_1p_2\bar{P}(1) + p(q_1p_2 + p_1q_2))\phi(0))R, & u = 1, \\
pq_1q_2\phi(0) - q_2\phi(u - 1) - \Xi(u, u, \omega)R^u, & 1 < u \leq a_2, \\
p\Xi(u, u, \omega), & a_2 \leq u. \end{array} \right. \tag{3.31}$$
Similarly to Theorem 3.1, we also can prove $\sum a_k = 1$, and $\sum |b_k| < +\infty$. According to the lemma 2.2, we can obtain

$$\lim_{u \to +\infty} \phi(u) = \frac{K(0, a_2)}{K_0}. \quad (3.30)$$

(3.30) is equivalent to (3.25). The proof is completed.

4. THE APPLICATION OF THE PENALTY FUNCTION

We will give some examples of ruin quantities (such as the ultimate ruin probability) to illustrate the application of the recursive formulas and asymptotic estimates for the penalty function $\phi(u)$.

Example 1. Let $\omega(x, y) = 1$, $\phi(u) = P r(T < +\infty | U(0) = u) = \psi(u)$, which is the ultimate ruin probability. By Theorem 3.1, when $a_1 > 0$, the asymptotic estimate for $\psi(u)$ is

$$\psi(u) \sim \frac{K_0^\psi}{K_0} R^{-u}, \quad (4.1)$$

where

$$K_0^\psi = K_1 - (R - 1)K_2 - (R - 1) \sum_{u=2}^{a_2} R^u \Xi_2(u, 1) + p(R - 1) \sum_{u=2}^{a_2} \Xi_4(u, 1)$$

$$\Xi_1(u, 1) = pp_1 \bar{P}(u) + p \sum_{k=0}^{u-1} \bar{P}(k + 1),$$

$$\Xi_2(u, 1) = pp_2 \bar{T}(u) + pp_1 \bar{P}(u) + p \sum_{k=0}^{u-2} \bar{T}(k + 1) + p \sum_{k=0}^{a_2-2} \bar{P}(k + 1),$$

$$K_1 = (R - 1)(q_{p_1}p_2\psi(0) + (q_{p_1}p_2\psi(1) - (q_{p_1}p_2 + pp_1p_2) \bar{P}(1))\psi(0)R) + p(q_{p_2}p_2 + p\psi(1)R(R - 1) + (R - 1)R^2 (q_{p_1}p_2\psi(2))) + (R - 1) \left( (q_{p_2}p_2 + pp_1p_2)\bar{T}(1) + p(q_{p_2}p_2 + p\psi(2)) \bar{P}(1) \right) R^2 - (R - 1)R^2 \psi(0) - q\psi(0)(R^{a_2+2} - R^2) - q\psi(a_1 - 1)(R^{a_2+2} - R^{a_1+2}),$$

$$K_2 = q_{p_2} \sum_{u=2}^{a_1} R^u \psi(u - 1) + q_{p_2} \sum_{u=2}^{a_2} R^u \psi(u - 1) + q_{p_2} \sum_{u=2}^{a_1} R^u \psi(u - 2) +$$

$$+ p_2 \sum_{u=2}^{a_1} \Xi_1(u, 1)R^u + q_{p_2} \sum_{u=2}^{a_1} \Xi_1(u - 1, 1)R^u$$

$$\Xi_4(u, 1) = R^u \sum_{k=u+1}^{+\infty} G(k).$$

$$+ p_2 \sum_{u=2}^{a_1} \Xi_1(u, 1)R^u + q_{p_2} \sum_{u=2}^{a_1} \Xi_1(u - 1, 1)R^u,$$

$$\Xi_4(u, 1) = R^u \sum_{k=u+1}^{+\infty} G(k).$$

5. Numerical Scheme

In [4], the initial term $\phi(0)$, $\phi(1)$, $\cdots$, $\phi(a_2)$ can be obtained by solving the set of linear equations, and $\phi(a_2 + 1)$, $\phi(a_2 + 2)$, are deduced by the recursive formulas in Lemma 2.1. We will compare the asymptotic values for the ruin probability, and analysis on the impact of the randomly paying dividends on the ruin probability.

The numerical analysis will be carried out under assumption of parameter as following: the distribution of claim amount $X_i$ is a zero-truncated geometric distribution with parameter $\alpha = 7/8$, then $f(k) = (1 - 7/8) (1/8)^{k-1}$, $i = 1, 2, \cdots$; $p = 0.85$, the threshold $(a_1, a_2) = (3, 5)$. And four cases with the probability of paying dividend $Q = (q_1, q_2) = (0.015, 0), (0.015, 0.025), (0.015, 0.055), (0.035, 0.055)$ will be performed. Under the four cases, the relative security loading $\theta > 0$, thus the set of linear equations has unique solution in Lemma 2.1, and the adjustment coefficient $R$ exist. The adjustment coefficient $R$ are computed and shown in Table 1. The exact values that calculated by recursive formulas in lemma 2.1 (see [4]) and the asymptotic values that are estimated by (3.1) are shown in 1 for the ruin probability and the distribution of the deficit at ruin. In all of figures, the E.V means the exact value, and the A.V means the asymptotic value.

Figure 1 shows that compare exact values with asymptotic values for the ruin probability under the four cases with different probability of paying dividends. From the Figure 1, we can find the asymptotic values are constantly close to the exact values with the surplus $u$ increasing, and are equal to the exact values when the $u$ is large enough.

6. Conclusion

The asymptotic estimate for the Gerber-Shiu discounted penalty function of the compound binomial risk model with randomly paying dividends to shareholders and policyholders in [4]
can be calculated in two case that the threshold of paying dividends to shareholders \( a_1 = 0 \) and \( a_1 > 0 \). And the asymptotic estimates of the ruin probability and the distribution function of deficit at ruin have been derived by the asymptotic estimate for the discounted penalty function in the case \( a_1 = 0 \) and \( a_1 > 0 \).
