Abstract: Let $\lambda_1(A) \geq \ldots \geq \lambda_n(A)$ denote the eigenvalues of a Hermitian $n \times n$ matrix $A$, our main results are $\log \lambda(C')p_w \log \lambda(A) \circ \lambda(B)$ and $\lambda(C')p_w \lambda(A) \circ \lambda(B)$. Here $A$ is a positive matrix, $B$ and $M = \begin{bmatrix} A & C' \\ C & B \end{bmatrix}$ are positive semi-definite Hermitian matrices.

Keywords: Eigenvalue, Positive Semi-definite Matrix, Majorization

1. INTRODUCTION

Let $A$ and $B$ be positive semi-definite. The following results due to Boying Wang and Fuzhen Zhang [1] says that

$$\prod_{i=1}^{k} \lambda_i(AB) \geq \prod_{i=1}^{k} \lambda_i(A) \lambda_{n-i+1}(B)$$

with $1 \leq i_1 < \ldots < i_k \leq n$.

Gunther and Klotz presented a survey focusing on the study of a block Hadamard and block Kronecker products of positive semidefinite matrices in 2012 [3]. Saliha Pehlivan [4] provided some trace inequalities for the trace of the block Hadamard product. In this paper, we shall be mainly interested in the inequalities for the trace of the block Hadamard product.

2. PRELIMINARIES

Let $\mathbb{C}^{n \times n}$ denote the vector space of all $n \times n$ complex matrices. Denote by $\lambda_i(A) \geq \ldots \geq \lambda_n(A)$ the eigenvalues of a Hermitian matrix $A \in \mathbb{C}^{n \times n}$.

Let $x = (x_1, x_2, \ldots, x_n)^T$, $y = (y_1, y_2, \ldots, y_n)^T$ with $x_1 \geq x_2 \geq \ldots \geq x_n$, $y_1 \geq y_2 \geq \ldots \geq y_n$. If

$$\sum_{i=1}^{k} x_i \leq \sum_{i=1}^{k} y_i, \quad k = 1, 2, \ldots, n,$$

we say that $x$ is weakly majorized by $y$, and write $x \preceq_w y$.

If

$$\prod_{i=1}^{k} x_i \leq \prod_{i=1}^{k} y_i, \quad k = 1, 2, \ldots, n,$$

we write $x \preceq_m y$, or $\log x \preceq_m \log y$.

3. MAIN RESULTS

We start with the following known results.

**Lemma 1.1** If $A, B \in \mathbb{C}^{n \times n}$ be Hermitian, then for any $1 \leq j \leq n$,

$$\max_{r+s=j+n} \{ \lambda_r(A) + \lambda_s(B) \} \leq \lambda_j(A+B) \leq \min_{r+s=j+1} \{ \lambda_r(A) + \lambda_s(B) \}.$$

**Lemma 1.2** If $A, B$ are the same order matrix, the $AB$ and $BA$ have the same non-zero eigenvalues. Similarly, the same order matrix $A, B, C$, $ABC$ and $CAB$ also have the same non-zero eigenvalues.

**Lemma 1.3** If $A, B \in \mathbb{C}^{m \times n}$ are positive semi-definite Hermitian and $1 \leq i_1 < \ldots < i_k \leq n$, then
\[ \prod_{j=1}^{k} \lambda_j(AB) \geq \prod_{j=1}^{k} \lambda_j(A)\lambda_{n-j+1}(B) \] with equality for \( k = n \).

**Lemma 1.4** For \( x, y \in \mathbb{R}^n \), \( \prod_{j=1}^{k} x_j^* \leq \prod_{j=1}^{k} y_j^* \), \( 1 \leq k \leq n \Rightarrow \sum_{j=1}^{k} x_j^* \leq \sum_{j=1}^{k} y_j^* \), \( 1 \leq k \leq n \). Where \( x_j^*, y_j^* \)
means reorder \( x_1, x_2, L, x_k \) and \( y_1, y_2, L, y_k \) from smallest to largest.

**Theorem 1** \( A, B, C \) are square matrices of order \( n \), with \( A \) being positive definite matrix, \( B \) and \( M = \begin{bmatrix} A & C^- \\ C & B \end{bmatrix} \) are positive semi-definite matrices, then \( \log \lambda(C^C) \ p_w \log \lambda(A) \circ\lambda(B) \), \( \lambda(C^C) \ p_w \lambda(A) \circ\lambda(B) \).

**Proof** Considered contract changes
\[
\begin{bmatrix} I & -A^{-1}C^- \\ 0 & I \end{bmatrix} \begin{bmatrix} A & C^- \\ C & B \end{bmatrix} \begin{bmatrix} I & -A^{-1}C^- \\ 0 & I \end{bmatrix} = \begin{bmatrix} A & 0 \\ 0 & B - CA^{-1}C^- \end{bmatrix}
\]
Due to \( M = \begin{bmatrix} A & C^- \\ C & B \end{bmatrix} \) is a positive definite matrix, from the properties of positive definite matrix we can know that \( B - CA^{-1}C^- \geq 0 \), in other words \( B \geq CA^{-1}C^- \), so, from lemma 1.1 we have \( \lambda_j(B) \geq \lambda_j(CA^{-1}C^-) \), from lemma 1.2 we have \( \lambda_j(CA^{-1}C^-) = \lambda_j(C^C) \), thus \( \lambda_j(B) \geq \lambda_j(C^C) \). from lemma 1.3 we know that
\[
\prod_{j=1}^{k} \lambda_j(B) \geq \prod_{j=1}^{k} \lambda_j(C^C) \lambda_{n-j+1}(A^{-1}), 1 \leq k \leq n.
\]
Due to \( \lambda_{n-j+1}(A^{-1}) = \frac{1}{\lambda_j(A)} \), we can know \( \prod_{j=1}^{k} \lambda_j(B) \lambda_j(A) \geq \prod_{j=1}^{k} \lambda_j(C^C) \), \( 1 \leq k \leq n \). So we can prove that \( \lambda(C^C) \ p_w \lambda(A) \circ\lambda(B) \). Obviously \( \prod_{j=1}^{k} \lambda_j(B) \lambda_j(A) = \prod_{j=1}^{k} \lambda_j^+(B) \lambda_j^+(A) \)
\[
\prod_{j=1}^{k} \lambda_j(C^C) = \prod_{j=1}^{k} \lambda_j^+(C^C), \text{ then we have } \prod_{j=1}^{k} \lambda_j^+(B) \lambda_j^+(A) \geq \prod_{j=1}^{k} \lambda_j^+(C^C), 1 \leq k \leq n. \text{ from lemma 1.4 we know that } \sum_{j=1}^{k} \lambda_j^+(A) \lambda_j^+(B) \geq \sum_{j=1}^{k} \lambda_j^+(C^C), 1 \leq k \leq n. \text{ So we can get that } \lambda(C^C) \ p_w \lambda(A) \circ\lambda(B).
\]
From \( \lambda(C^C) \ p_w \lambda(A) \circ\lambda(B) \) we can get that \( \lambda(C^C)^p \ p_w \lambda(A^p) \circ\lambda(B^p) \), where \( 0 < p < 1 \).
In particular, when \( p = \frac{1}{2} \), we can also get \( \delta(C) \ p_w \lambda(A^{\frac{1}{2}}) \circ\lambda(B^{\frac{1}{2}}) \), and then we can get
\[
\delta(C) \ p_w \lambda(A^{\frac{1}{2}}) \circ\lambda(B^{\frac{1}{2}}). \text{ When } k = n, \prod_{j=1}^{n} \lambda_j(B) \lambda_j(A) \geq \prod_{j=1}^{n} \lambda_j(C^C), \text{ we can know that } \det \ A \det B \geq \det(C^C).
\]
**Note**
we know that when \( A, B \geq 0 \), \( \lambda(A \circ B) \ p_w \lambda(A) \circ\lambda(B) \) is true, but the inequality in the above theorem cannot be strengthened to \( \lambda(C^C) \ p_w \lambda(A \circ B) \).
Here is an example:

Take $A = \begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix}$, $B = \begin{bmatrix} 3 & 2 \\ 2 & 1.6 \end{bmatrix}$, $C = \begin{bmatrix} 1 & 1 \\ 2 & 1 \end{bmatrix}$, it can be calculated that $\text{tr}(C^*C) \geq \text{tr}(A \circ B)$.

**Corollary 1**

$A, B, C, M$ conditions are the same as above, the $\text{tr}A \circ B \geq \text{tr}(C^*C)$.

**Corollary 2**

Let $A, B$ are $n$-order Hermitian matrix, and the block matrix $\begin{bmatrix} A & C^* \\ C & B \end{bmatrix} \geq 0$, $B \geq 0$, then $\delta(C) p_{\text{wlog}} u$, where $u = (u_1, u_2, ..., u_n)$, $u_i = \max\{\lambda_i(A), \lambda_i(B)\}$.
